WorkRadar — Product Requirements Document

AI-powered daily command center for engineering managers | Version 1.0 (MVP) | October 2026

1. Problem Statement

Engineering managers spend the first 45–90 minutes of each day piecing together team status from Slack, Jira, GitHub and email. Signals are scattered, noisy and unranked: a production incident in a Slack thread, a PR waiting three days for review and a ticket silently stuck in “In Progress” look equally unimportant until they become escalations. Managers either over-check (context switching, lost focus time) or under-check (missed blockers, slower delivery). **WorkRadar** ingests activity from these tools and uses AI to produce one consolidated, prioritized view that answers four questions in under two minutes: **What is the top work today? What happened? What needs my attention now? Who is blocked?**

2. Target Users

- **Primary:** Engineering managers and team leads running 5–15 person teams across Slack, Jira, GitHub and email.
- **Secondary:** Directors / heads of engineering overseeing several teams; Scrum masters and delivery/program managers tracking cross-team dependencies.

3. User Personas

Persona	Profile	Goals	Frustrations
Priya Engineering Manager	Leads 8 engineers on a payments product; hybrid; ~6 hrs/day in meetings.	Unblock people fast; protect sprint goals; walk into stand-up already informed.	Learns about blockers a day late; scrolls 300+ Slack messages each morning.
Arjun Tech Lead	Senior IC who also coordinates 5 engineers; codes 60% of the time.	Keep PRs moving; spot risky changes; minimize time spent on status chasing.	Review requests pile up; constant pings for “any update?” break focus.
Meera Director of Engineering	Oversees 4 teams / 40 people; weekly exec reporting.	Spot cross-team risk early; get a reliable roll-up without micromanaging.	Status reports are stale, inconsistent and manually compiled.

4. User Journey (Priya’s morning, before vs. with WorkRadar)

Stage	Today (without WorkRadar)	With WorkRadar
1. Arrive (9:00)	Opens Slack, Jira, GitHub, Gmail in four tabs.	Opens one dashboard; AI Daily Brief is already generated.
2. Scan	Reads channels and threads to reconstruct yesterday.	Reads a 5-bullet summary of what happened, with source links.
3. Triage	Guesses urgency; often misses an aging PR or a silent blocker.	Sees a ranked “Needs Attention” list with the reason for each rank.
4. Unblock	DMs people one by one to ask for status.	“Who’s Blocked” panel shows person, blocker, duration, owner; one-click nudge.
5. Stand-up (9:30)	Status round-robin consumes most of the meeting.	Stand-up focuses on decisions; AI talking points are pre-drafted.
6. During day	Re-checks tools reactively.	Gets an alert only when a new critical item or blocker appears.

5. Key Pain Points

- **Fragmentation:** status lives in 4+ tools with no single source of truth; constant context switching.
- **Signal vs. noise:** high message volume buries the few items that truly matter; nothing is ranked by urgency or impact.
- **Invisible blockers:** people rarely announce they are stuck; blockers surface late as stale tickets or unanswered threads.
- **Review bottlenecks:** PRs wait days for review; dependencies on other teams go untracked.
- **Manual reporting:** compiling stand-up notes and weekly updates is repetitive and quickly out of date.

6. Success Metrics

Category	Metric	MVP Target
Efficiency	Time for a manager to get daily situational awareness	From ~60 min to < 10 min
Adoption	Daily active managers / onboarded managers (DAU/MAU)	≥ 60% after 4 weeks
Outcome	Median time a blocker stays unresolved (detection → resolution)	30% reduction
Outcome	PRs waiting > 48h for review	40% reduction
AI quality	Attention items rated “useful” (thumbs up) / false-positive rate	≥ 80% useful / < 15% FP
Satisfaction	Manager NPS; % saying they skip opening other tools in the morning	NPS ≥ 40; ≥ 50%

7. MVP Scope

In scope	Out of scope (post-MVP)
• Single-team web dashboard for one manager. • Mock data for Slack, Jira, GitHub and Email via a unified event schema (adapters swappable for real APIs later). • AI Daily Brief, priority scoring, blocker detection, Ask WorkRadar chat. • Filters by source, person and priority; links back to source items. • Responsive layout (desktop-first, usable on mobile).	• Live OAuth integrations and webhooks. • Multi-team / org-wide roll-ups and RBAC. • Writing back to tools (e.g., changing ticket status). • Native mobile apps, push notifications. • Performance analytics on individuals (explicitly excluded to avoid surveillance).

8. Assumptions

- Teams already use Slack, Jira, GitHub and email; read-only API access is obtainable with admin approval in later phases.
- Mock data realistically represents the volume and shape of a 5–15 person team's daily activity.
- An LLM (e.g., Claude via API) can reliably summarize and classify work events when given structured context; a rules-based fallback covers failures.
- Managers prefer a ranked, explainable list over raw feeds, and will act on AI suggestions if each item shows its reason and source.
- Data is processed with least-privilege access; message content is not used to evaluate individual performance.

9. Features

Priority	Feature	Description
Must-have	AI Daily Brief	Auto-generated summary of top work for today and what happened in the last 24 hours, each bullet linked to its source.
Must-have	Needs Attention queue	Items ranked by an AI + rules priority score (severity, age, customer impact, deadline proximity, mentions of the manager) with a one-line "why".
Must-have	Who's Blocked panel	Detects blockers from explicit flags, keywords ("blocked", "waiting on"), stale tickets and PRs awaiting review; shows person, cause, duration, owner.
Must-have	Unified activity timeline	Chronological feed across all four sources with source icons and filters by tool, person and priority.
Must-have	Team snapshot	Per-person card: current focus, open PRs/tickets, status (on track / at risk / blocked).
Must-have	Ask WorkRadar (chat)	Natural-language Q&A grounded in team data, e.g., "What's at risk for Friday's release?"
Nice-to-have	One-click actions	Draft a nudge message, reassign a reviewer or create a follow-up task directly from an item.
Nice-to-have	Stand-up & weekly report generator	AI-drafted stand-up talking points and an exportable weekly status report.
Nice-to-have	Smart alerts & digest	Real-time notification only for new critical items; optional morning email/Slack digest.
Nice-to-have	Trends & risk forecast	Sprint-health trends, recurring blockers and early warning on slipping deliverables.
Nice-to-have	Live integrations & multi-team view	OAuth connectors for real tools; director-level roll-up across teams.
