WorkRadar

High-fidelity UI designs: Dashboard, Priority Feed, Item Details, Search, Empty & Error states

Designed and built with AI (Claude), rendered from the working MVP so design and product match pixel for pixel.

DESIGN PRINCIPLES

Answer first
The AI brief sits above everything: a headline and four answers before any list.

Always explain
Every rank shows its reasons; every AI sentence links to its source items.

Act in place
Assign, Snooze and Mark done on every row, each with one-tap Undo.

Calm by default
Color only signals priority and state; everything else stays neutral.

COLOR & TYPE

Inter · 22/700 page titles · 15/650 card titles · 14/600 item titles · 13/400 body

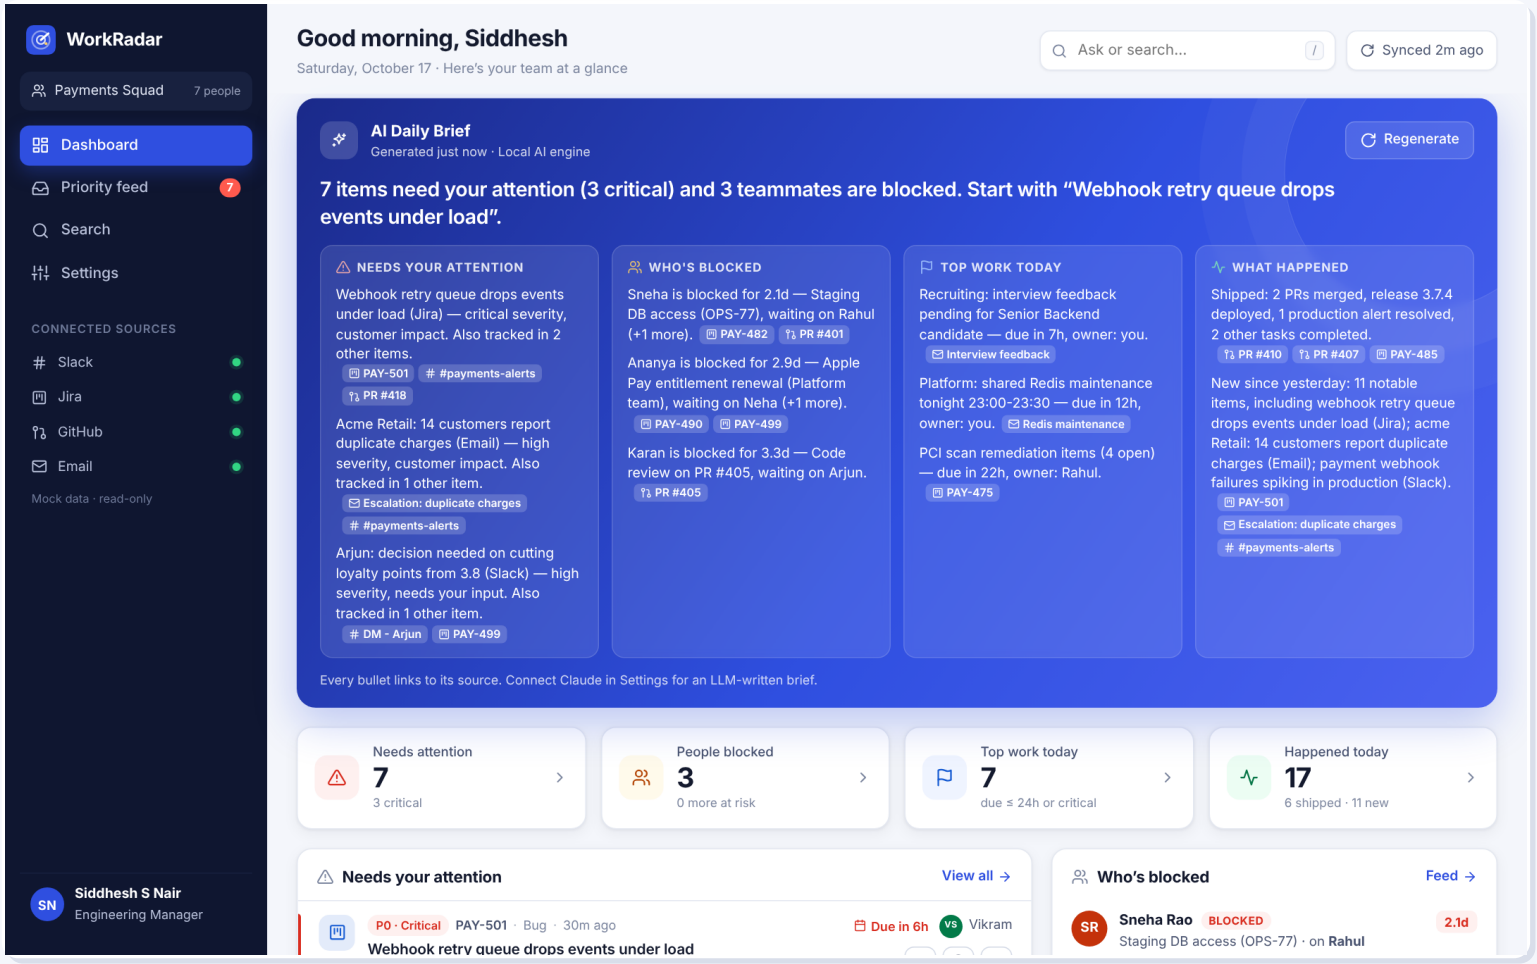

Light and dark themes from one set of tokens · responsive 390 to 1440 px

SCREENS

02 Dashboard

Above the fold: the four manager questions answered in one screen

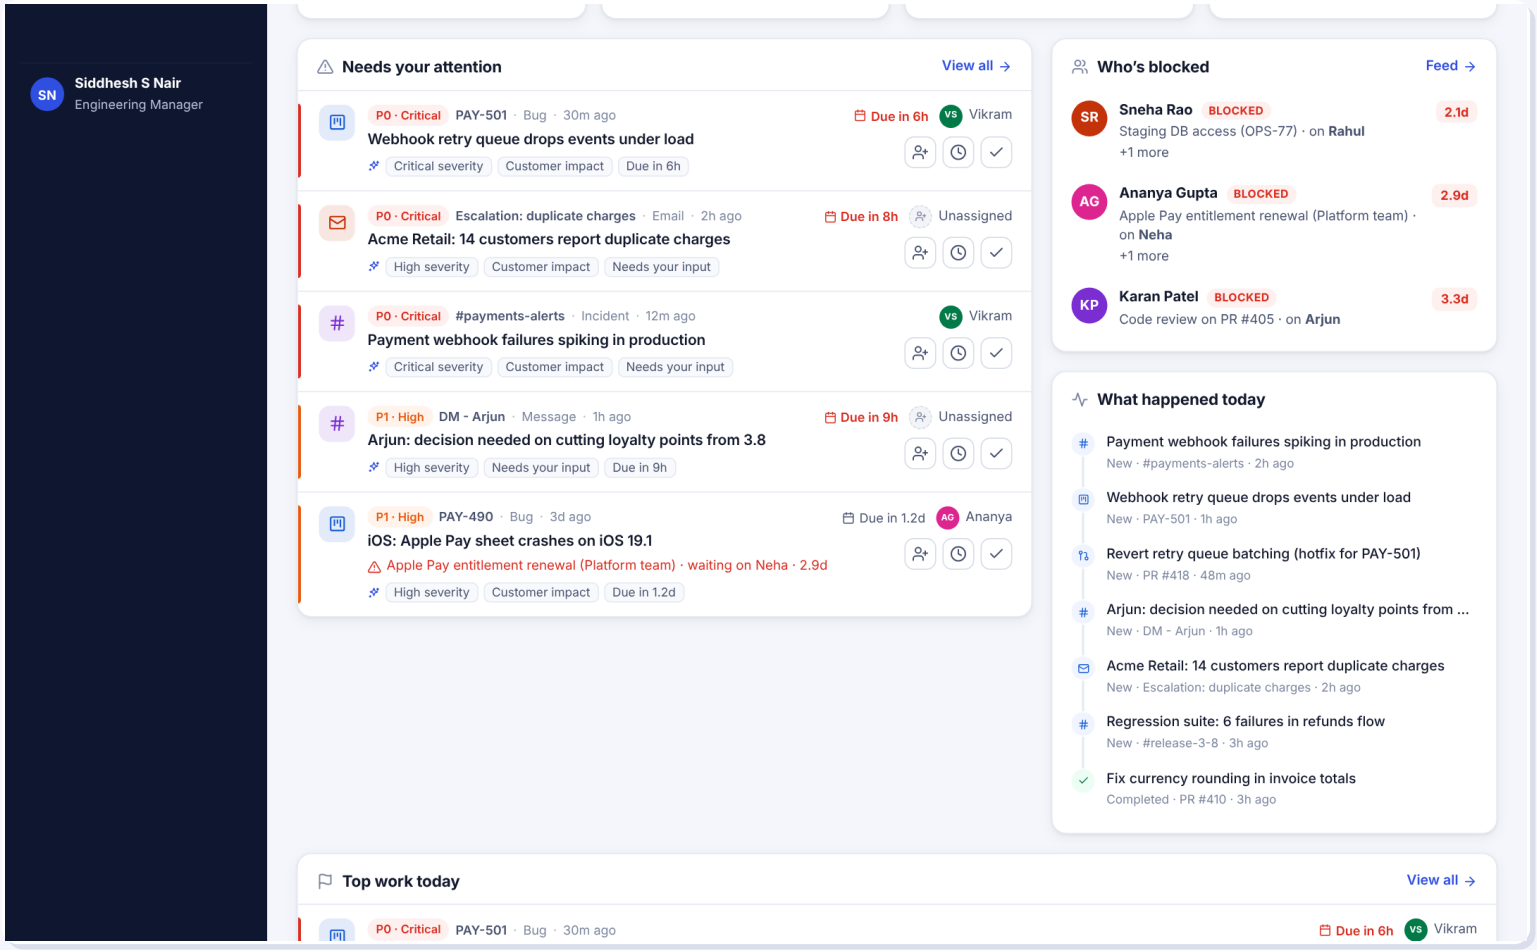

DESIGN NOTES

1. **AI Daily Brief** leads with a one-line headline, then four sections: Needs attention, Who's blocked, Top work today, What happened.
2. Each bullet ends in **source chips** (PAY-501, PR #418…) that open the item, so the summary can always be verified.
3. Related signals from different tools are **merged**: incident + Jira bug + hotfix PR become one bullet.
4. **KPI tiles** double as shortcuts into the matching filtered feed.
5. Priority feed badge (7) in the sidebar keeps the attention count visible everywhere; source health dots show sync status.
6. Regenerate re-runs the brief; the label shows which engine wrote it (local or Claude).

03 Dashboard

Below the fold: attention queue, blockers and today’s timeline

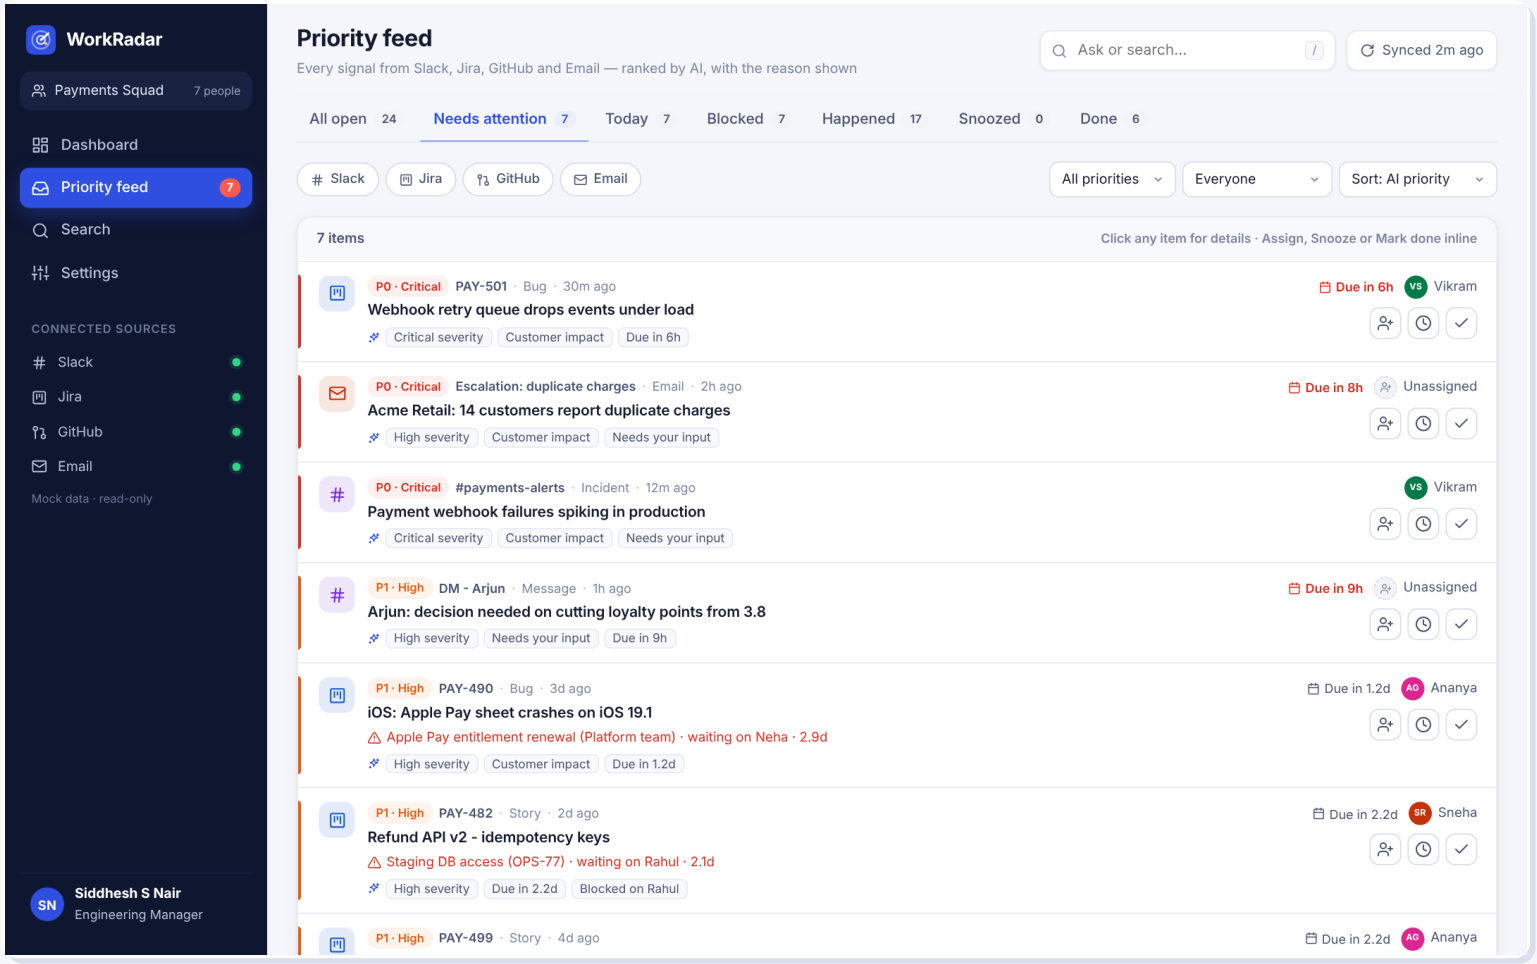

DESIGN NOTES

1. **Needs your attention**: top five P0/P1 items with reason tags and inline Assign / Snooze / Done.
2. **Who’s blocked** groups blockers per person and de-duplicates the same blocker reported in Slack and Jira; the red pill shows how long.
3. Blocker types are distinguished: Blocked, Waiting on review, At risk (silent for 3+ days).
4. **What happened today** is a timeline of shipped work and new notable items.
5. Further down: **Top work today** (due within 24h or critical) and a **Team snapshot** with each person’s focus, load and On track / At risk / Blocked state, framed for unblocking, not surveillance.

04 Priority Feed

Every signal from four tools in one ranked, explainable list

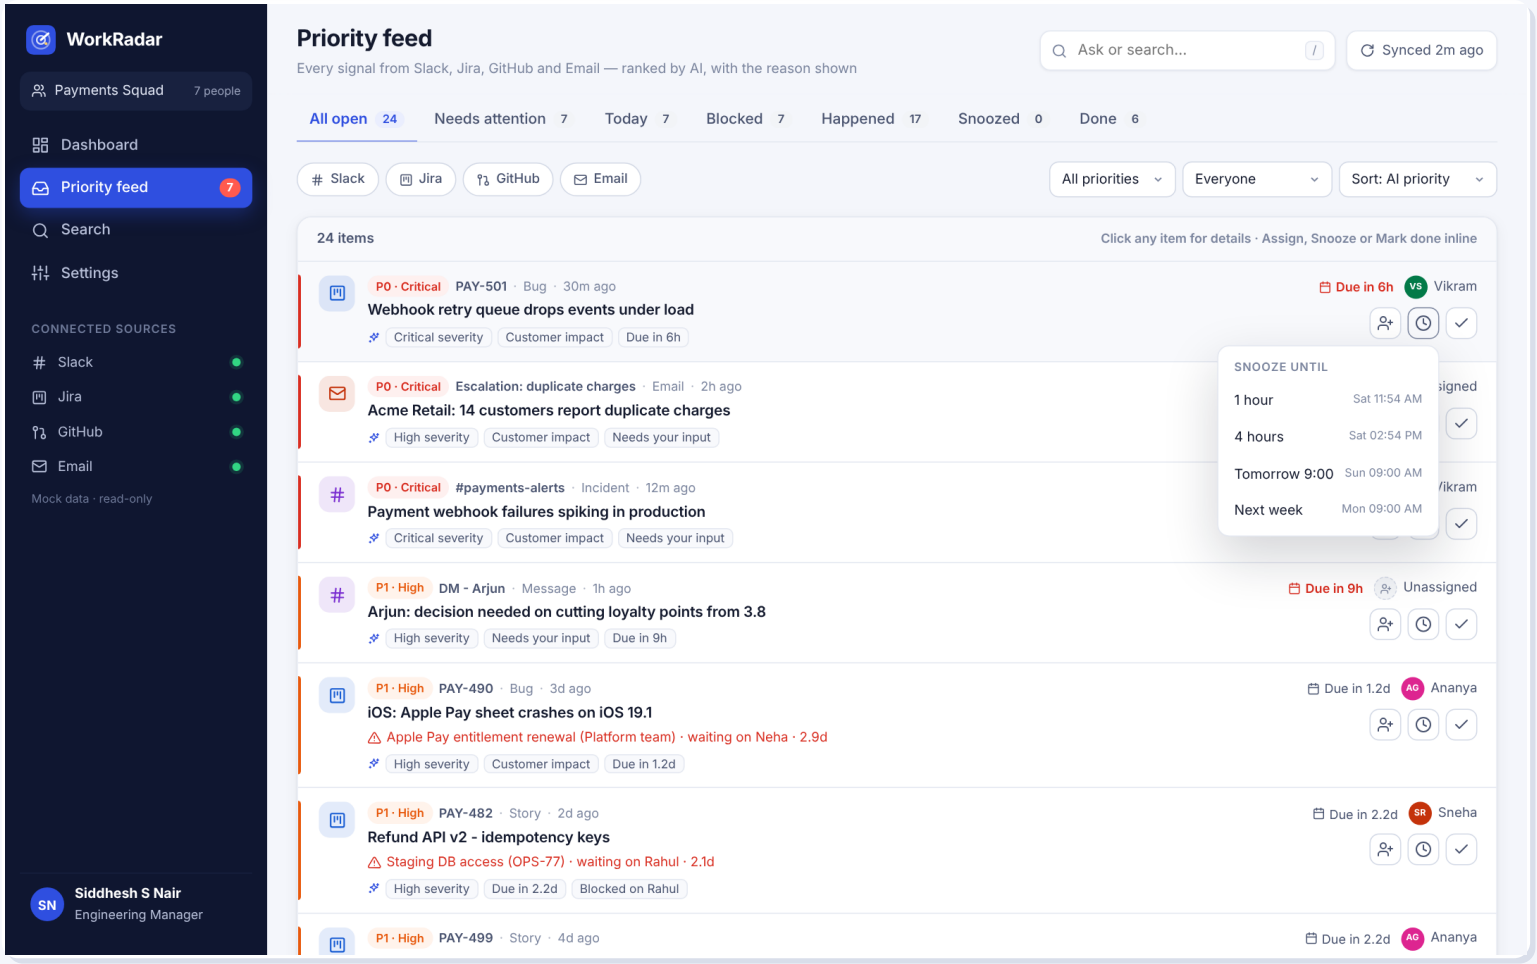

DESIGN NOTES

1. **Tabs** with live counts: All open, Needs attention, Today, Blocked, Happened, Snoozed, Done.
2. **Filters**: source chips, priority, person, sort (AI priority, most recent, due date). Clear resets all.
3. Row anatomy: priority color bar → source icon → P-level, ref, type, age → title → blocker line → **“why” tags** → due date, owner, actions.
4. The **why tags** are the actual scoring reasons, so the ranking is never a black box.
5. Whole row opens the detail page; Enter key works for keyboard users.

05 Priority Feed: inline actions

Snooze, Assign and Mark done without leaving the list

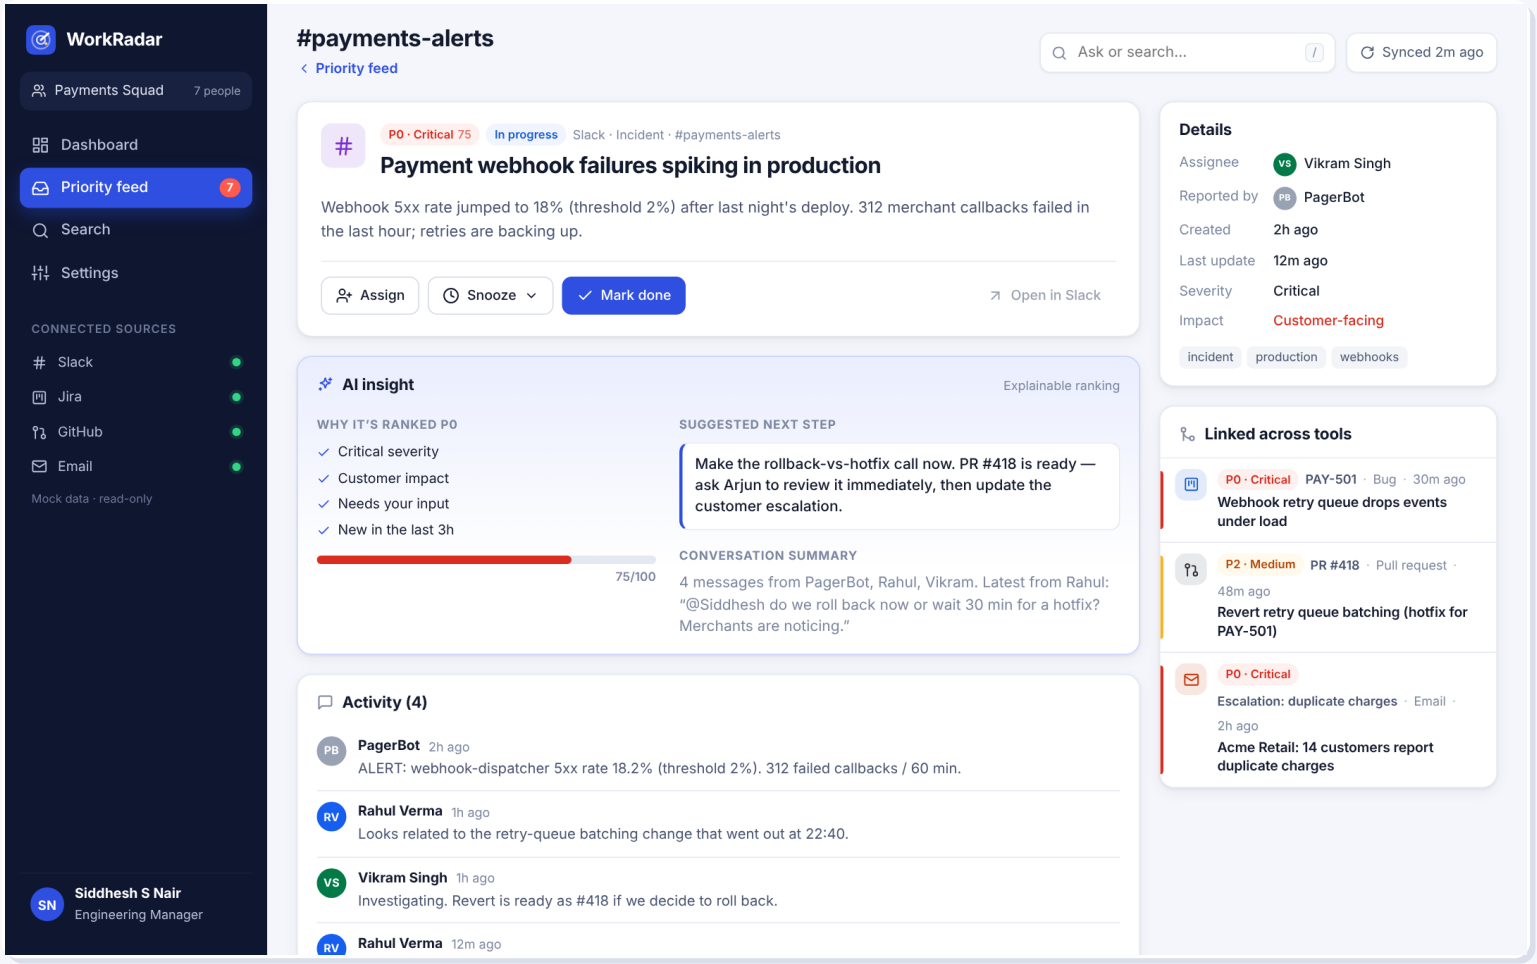

DESIGN NOTES

1. **Snooze** menu offers 1 hour, 4 hours, Tomorrow 9:00 and Next week, with exact times shown.
2. Snoozed items leave the feed and brief, then return automatically; they stay findable under the Snoozed tab and in search.
3. Every action shows a **toast with Undo** (6 s), so triage is fast and safe.
4. Icon-only buttons have tooltips and labels for screen readers.

06 Item Details

Full context, the AI's reasoning and the recommended next step

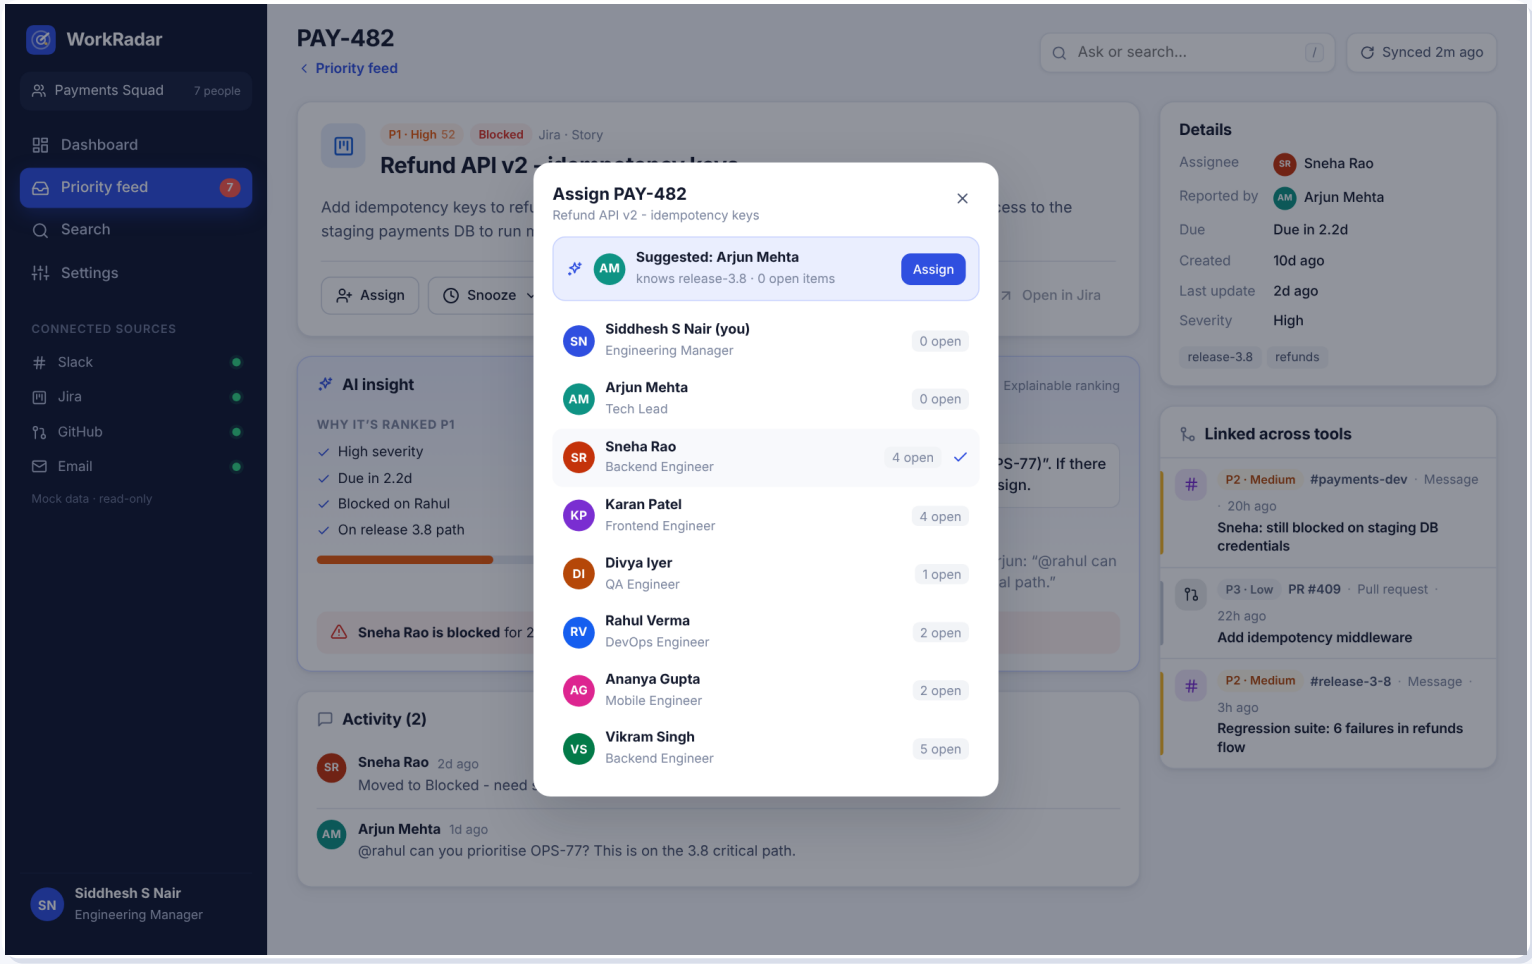

DESIGN NOTES

1. Header: source, P-level with score (75), status, title, body and the **action bar**: Assign, Snooze, Mark done, Open in source.
2. **AI insight**: why it is ranked P0 (reason list + score bar), a concrete **suggested next step**, and a conversation summary.
3. **Activity** merges the source thread with your WorkRadar actions (highlighted) as an audit trail.
4. **Linked across tools** shows the same issue in Jira, GitHub and Email.
5. Details card: assignee, reporter, due, created, last update, severity, customer impact, labels.

07 Item Details: Assign

AI-suggested assignee with transparent reasoning

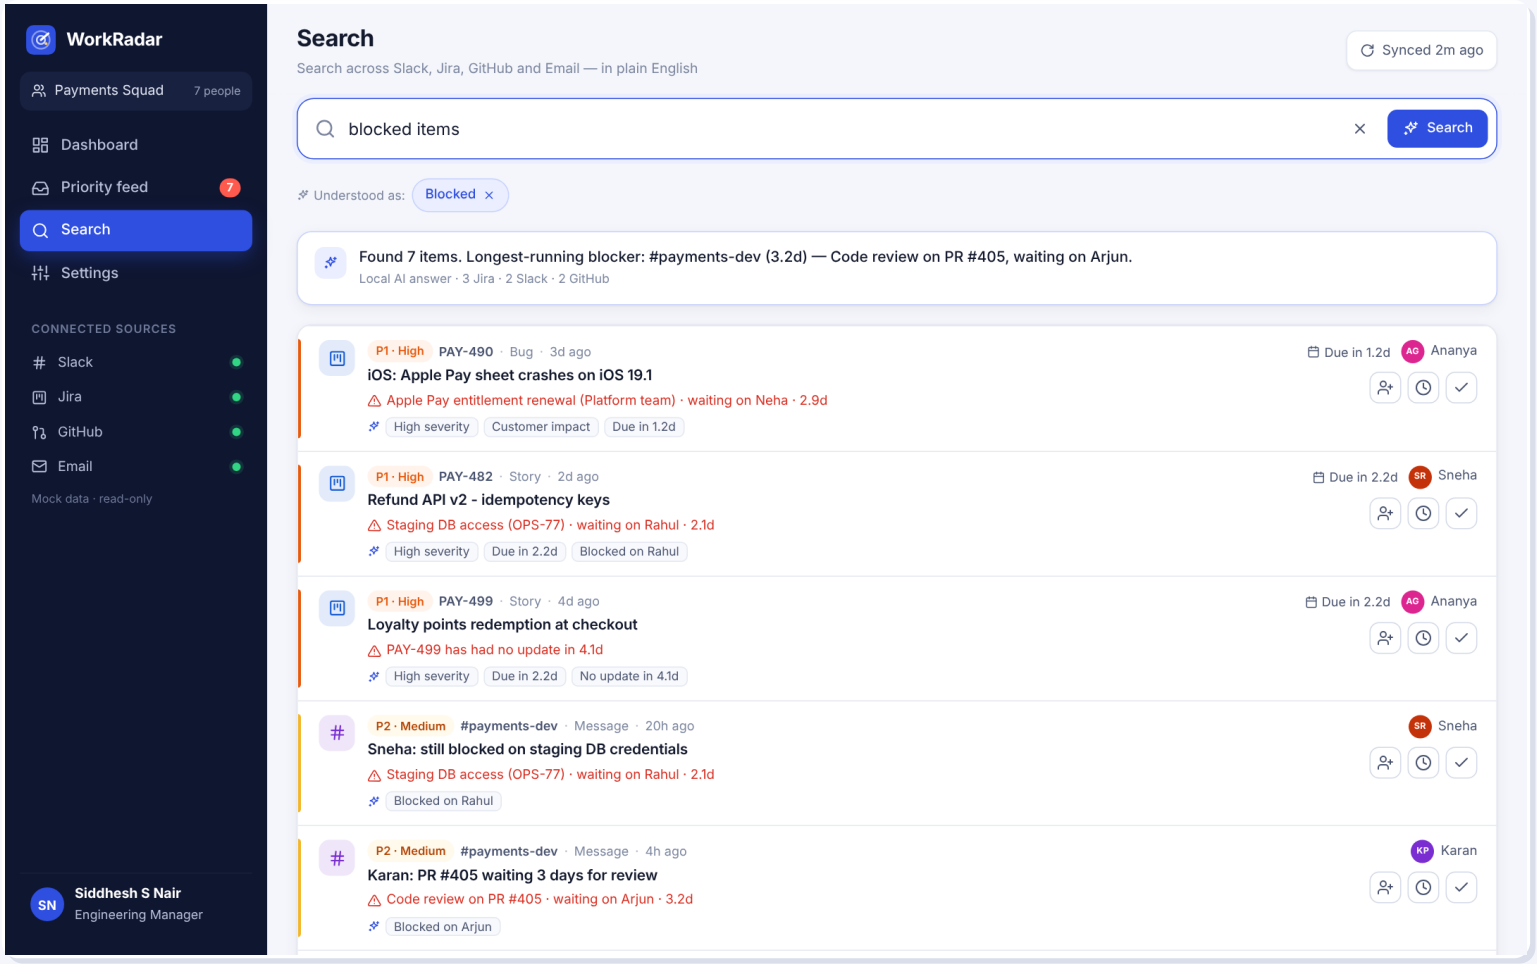

DESIGN NOTES

1. The top suggestion is based on **skill match** (labels), **involvement** in related items and **current workload**; the reason is shown.
2. The full team list shows each person's open item count, so the manager can override the AI with one click.
3. Current assignee is marked with a check; Esc or clicking outside closes the dialog.

08 Search

Natural-language search across all tools, with an AI answer

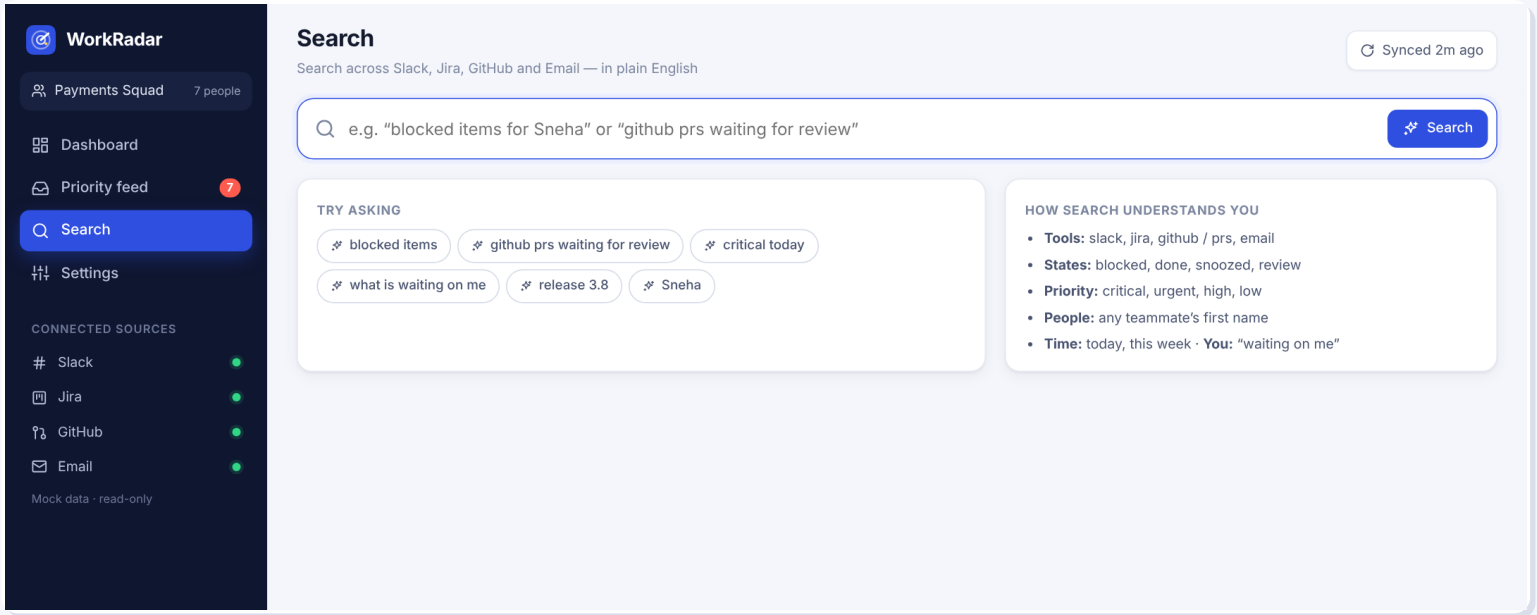

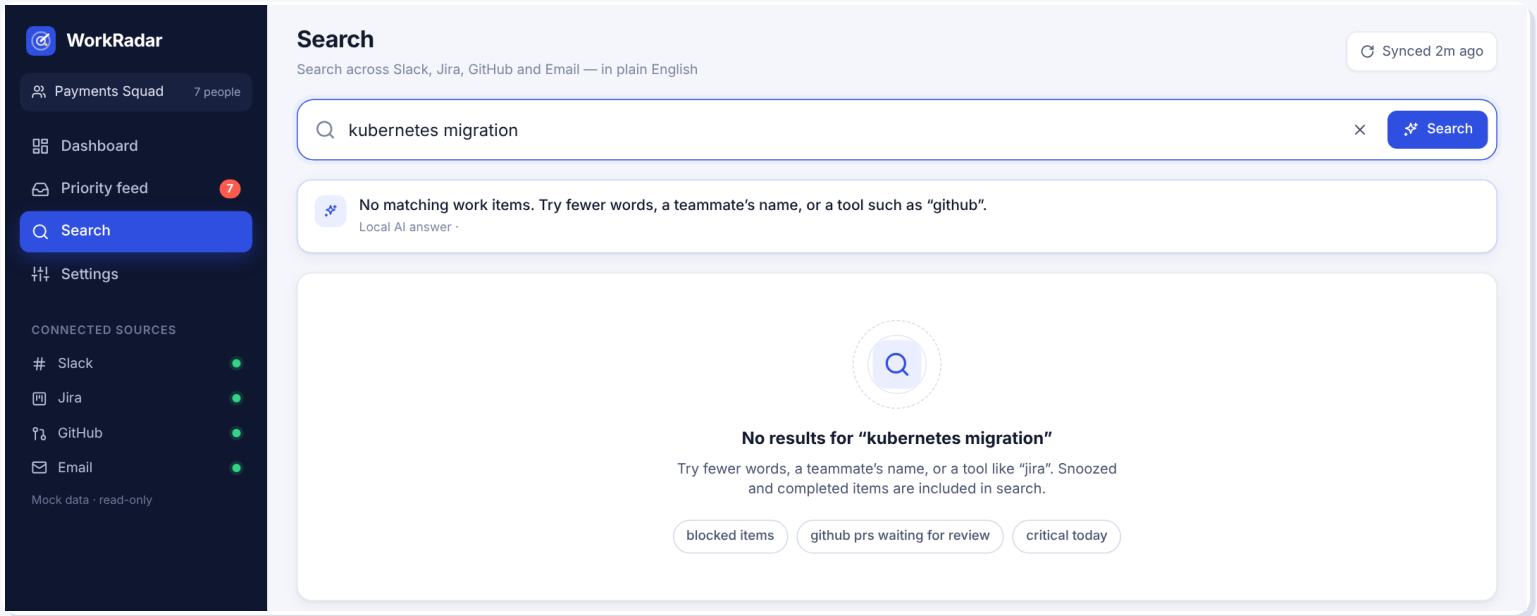

DESIGN NOTES

1. Plain-English queries: “blocked items for Sneha”, “github prs waiting for review”, “critical today”, “what is waiting on me”.
2. **Understood as** chips show how the query was interpreted; tap a chip to remove that filter.
3. An **AI answer** card summarizes the results, e.g. the longest-running blocker and who it is waiting on.
4. Results reuse the feed row, so actions work the same everywhere.

09 Search: start & no results

Guiding the first query, and recovering from a miss

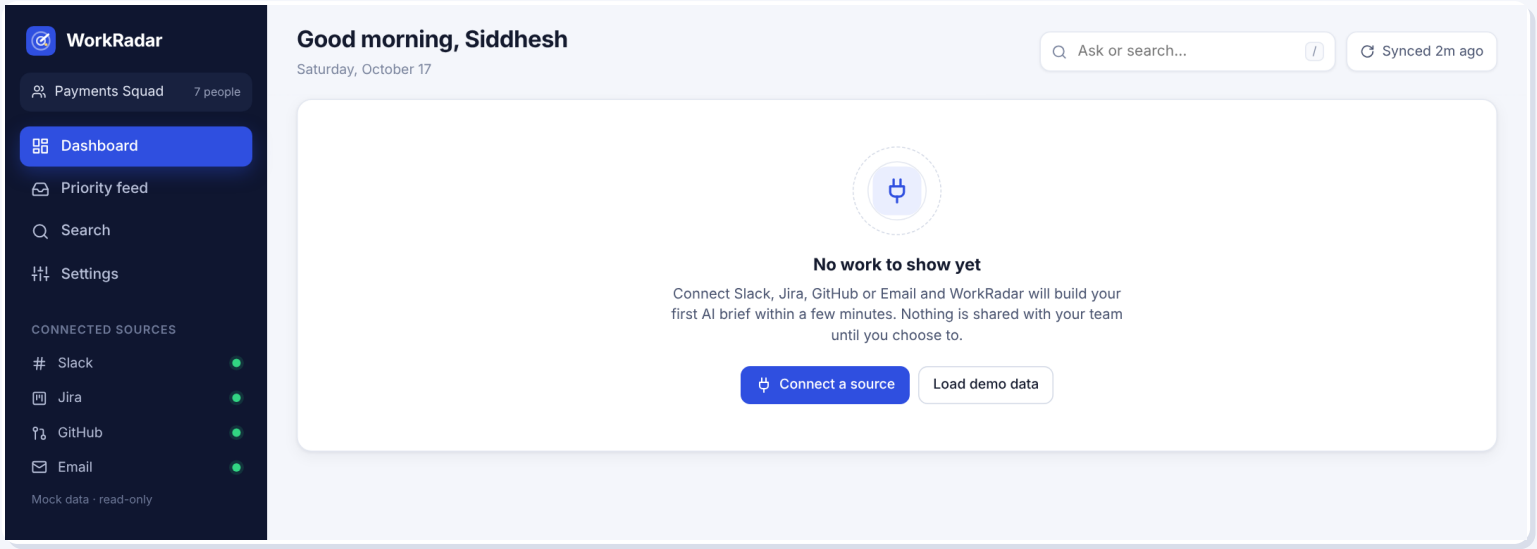

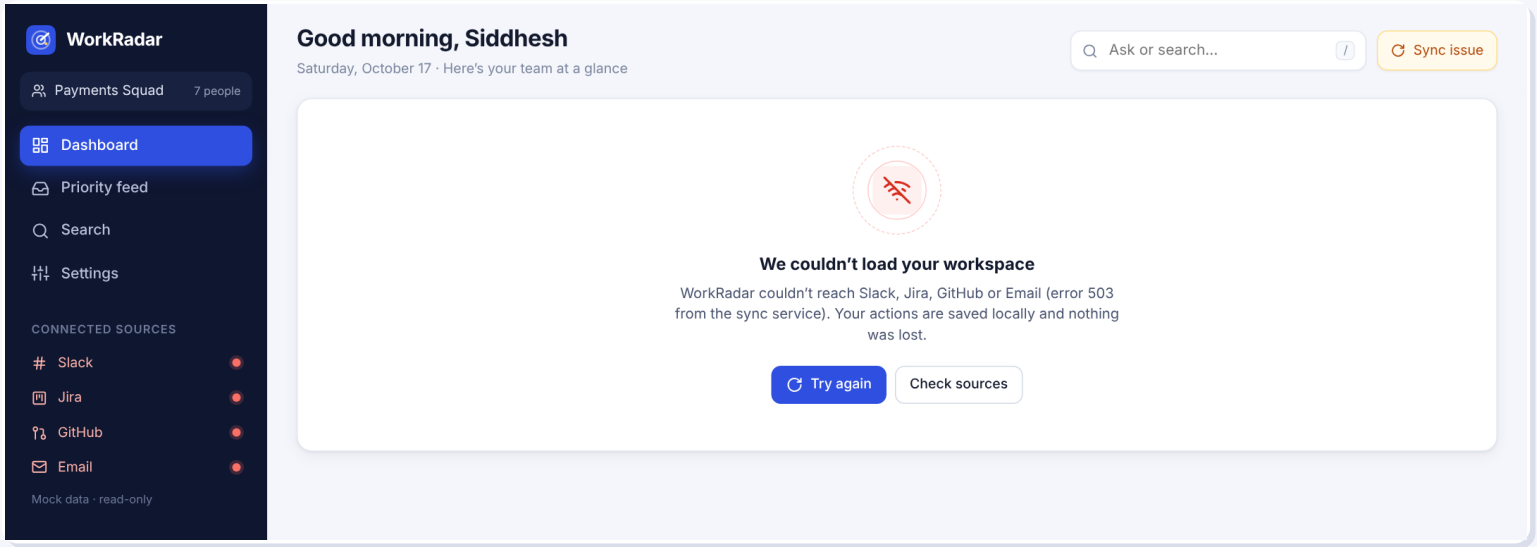

DESIGN NOTES

1. **Start state**: suggested queries, recent searches and a cheat sheet of what the search understands (tools, states, priority, people, time).
2. **No results**: says exactly what was searched, suggests how to broaden, and offers one-tap example queries instead of a dead end.
3. Snoozed and completed items are included in search so nothing is ever lost.

10 Empty & Error states

First run with no data, and a full outage of the sync service

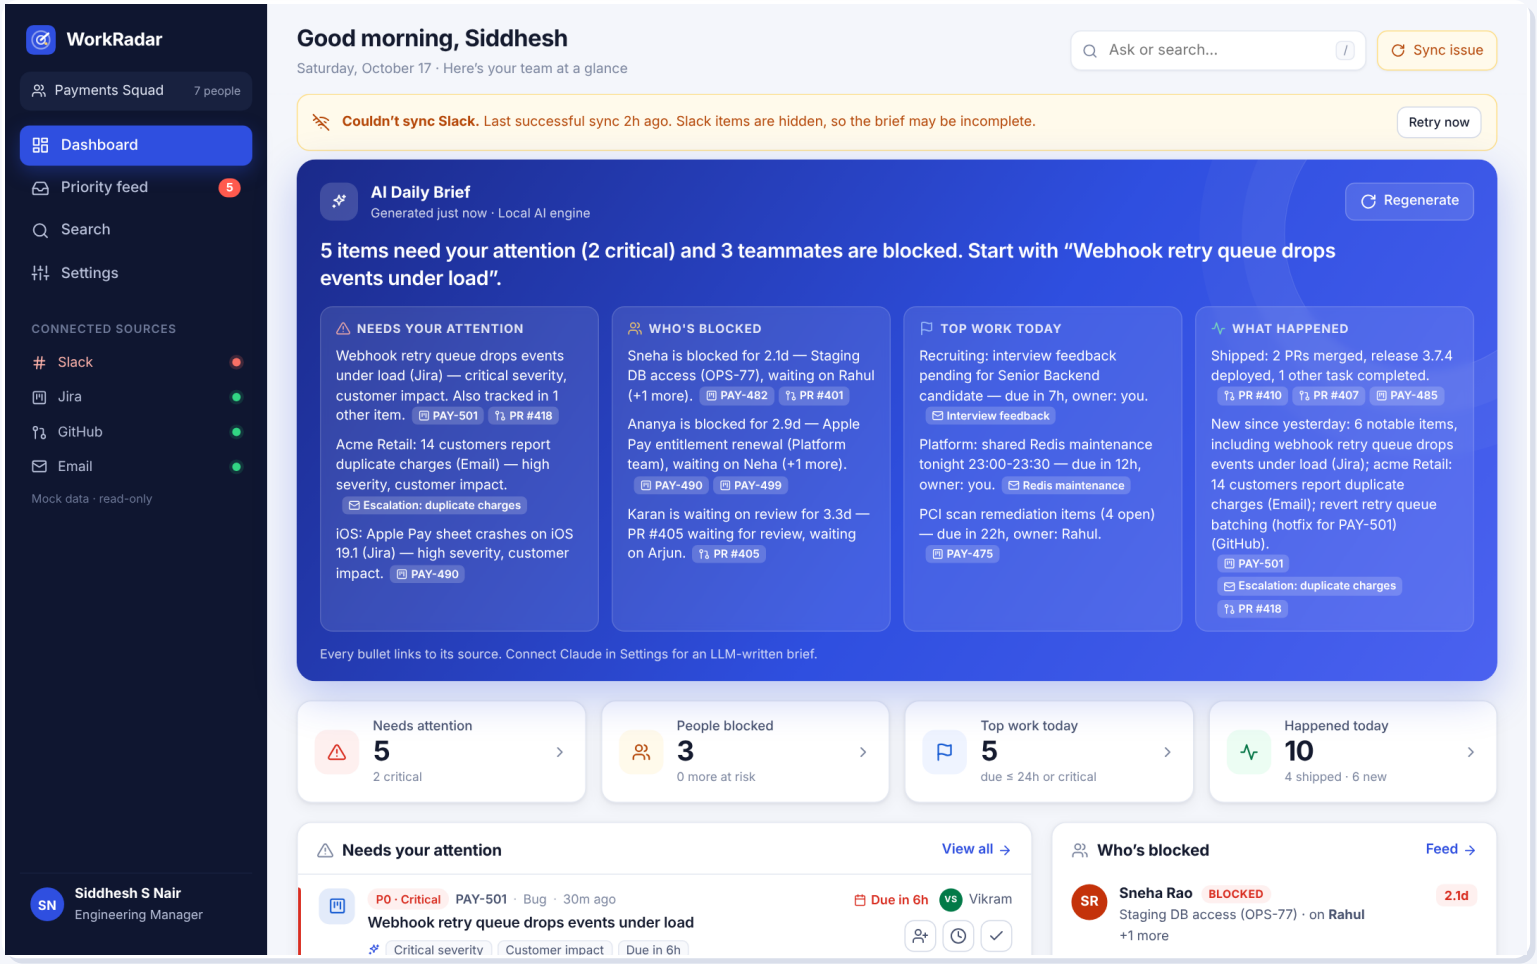

DESIGN NOTES

1. **Empty workspace**: explains what WorkRadar will do and gives one primary action (Connect a source) plus a demo-data option.
2. **Outage**: plain-language error with the cause (503 from sync service), reassurance that local actions are safe, and a **Try again** retry.
3. Sidebar source dots turn red so the failing tools are obvious at a glance.
4. Inside cards, smaller empty states handle “Nothing urgent”, “No one is blocked”, “Inbox zero” and “Nothing snoozed”.

11 Partial error: one source failing

Degrade gracefully instead of failing the whole dashboard

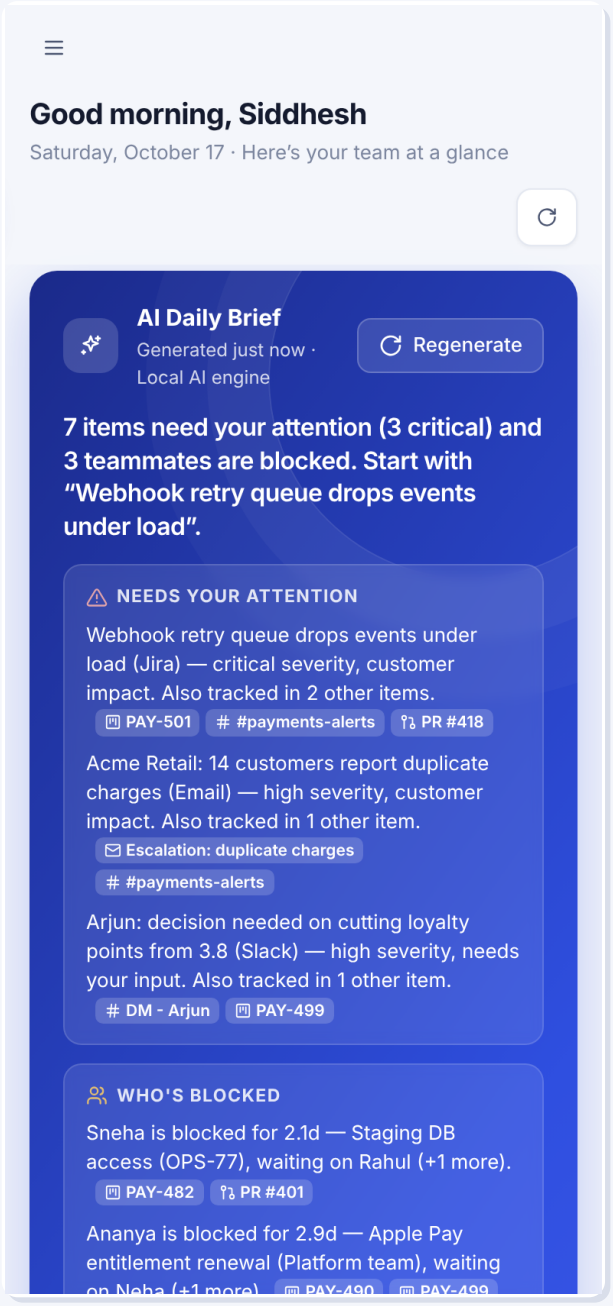

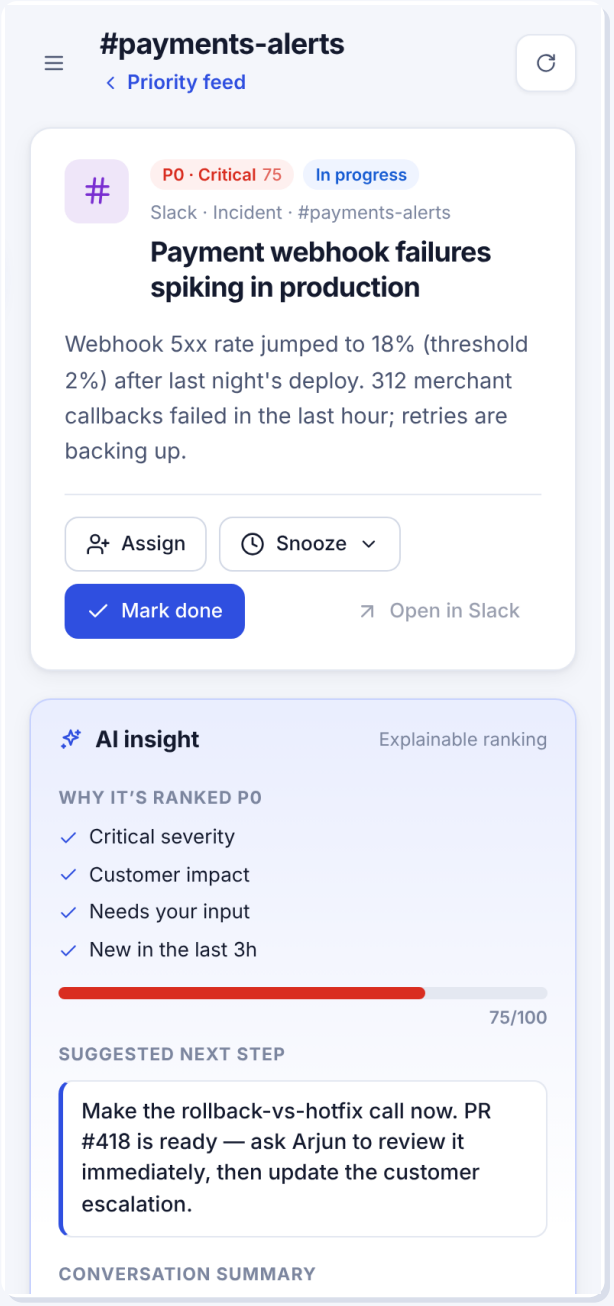

DESIGN NOTES

1. An amber **banner** names the failing source (Slack), the time of the last good sync, and the impact ("brief may be incomplete").
2. **Retry now** in the banner and the top-bar sync button both re-sync; success shows a confirmation toast.
3. Everything that did sync still works: the brief and counts recompute from the remaining sources.
4. The sync button turns amber ("Sync issue") on every page until resolved.

12 Mobile

The same product at 390 px: drawer navigation, stacked cards, thumb-friendly actions

DESIGN NOTES

1. Sidebar collapses into a **drawer** behind the menu button.
2. Brief sections and KPI tiles stack into a single column; source chips stay tappable.
3. Feed rows move owner and actions onto their own line to keep 32 px+ touch targets.
4. The detail page keeps the action bar near the top so the main decision is one tap away.
